

1
2 **CLAIMS**

3 What is claimed is:

4
5 1. A method comprising:

6 determining randomly distributed features in an object;

7 compressing data representing the randomly distributed features;

8 encoding the compressed data with a signature; and

9 creating a label that includes the object and the encoded data.

10
11 2. The method as recited in Claim 1, wherein compressing the data
12 includes:

13 determining a probability density function associated with the object;

14 determining vectors associated with the randomly distributed attributes
15 based, at least in part, on the probability density function; and

16 encoding the vectors using an arithmetic coding algorithm.

17
18 3. The method as recited in Claim 2, wherein encoding the vectors
19 using the arithmetic coding algorithm includes determining a path for connecting a
20 portion of the vectors within a fixed amount of data.

21
22 4. The method as recited in Claim 2, wherein the randomly distributed
23 features are fibers that are randomly positioned in the object.

1 5. The method as recited in Claim 4, wherein the probability density
2 function represents a probability that fibers in the particular region are illuminated
3 by a light source.

4
5 6. The method as recited in Claim 4, wherein the probability density
6 function is derived based, at least in part, on the length of the fibers.

7
8 7. The method as recited in Claim 4, wherein each vector represents the
9 end points of two fibers.

10
11 8. The method as recited in Claim 1, wherein the data is encoded with a
12 private key.

13
14 9. The method as recited in Claim 1, wherein the label is a certificate of
15 authenticity configured to be self-authenticated and wherein the object is an
16 authentication object included in the certificate of authenticity.

17
18 10. The method as recited in Claim 1, wherein the encoded data is
19 included in the label as a barcode.

20
21 11. The method as recited in Claim 1, further comprising:
22 determining textual data that includes a string of characters;
23 hashing the textual data with an algorithm;
24 encrypting the compressed data using the hashed textual data; and
25 including the textual data in the label.

1
2 12. The method as recited in Claim 11, wherein the algorithm is a
3 cryptographically secure hash algorithm.

4
5 13. The method as recited in Claim 11, wherein the algorithm is an
6 SHA1 cryptographical algorithm.

7
8 14. One or more computer-readable memories containing instructions
9 that are executable by a processor to perform the method recited in Claim 1.

10
11 15. A system comprising
12 an issuer configured to determine randomly distributed features in an
13 authentication object and to compress data representing the randomly distributed
14 features, the issuer being further configured to encode the compressed data with a
15 signature and to create a label that includes the authentication object and the
16 encoded data.

17
18 16. The system as recited in Claim 15, wherein the issuer is further
19 configured to determine a probability density function associated with the
20 authentication object, to determine vectors associated with the randomly
21 distributed attributes based, at least in part, on the probability density function, and
22 to encode a portion of the vectors as a path by applying an arithmetic coding
23 algorithm.

1 17. The system as recited in Claim 15, wherein the issuer is further
2 configured to encode the compressed data with a private key.

3
4 18. The system as recited in Claim 15, wherein the issuer is further
5 configured to include a barcode with the encoded data in the label.

6
7 19. The system as recited in Claim 15, wherein the issuer is further
8 configured to determine textual data that includes a string of characters and to
9 hash the textual data with an algorithm.

10
11 20. The system as recited in Claim 19, wherein the issuer is further
12 configured to encrypt the compressed data using the hashed textual data and to
13 include the textual data in the label.

14
15 21. The system as recited in Claim 15, further comprising:
16 a verifier configured to decode the data representing the randomly
17 distributed features in the label and to authenticate the label by comparing the
18 decoded data with the data of the actual randomly distributed features determined
19 from the authentication object.

20
21 22. A label comprising:
22 an authentication object including randomly distributed features; and
23 encoded information associated with the authentication object, the
24 information being encoded with a signature and including compressed data
25 representing the randomly distributed features in the authentication object,

1 wherein the label is self-authenticated by comparing the compressed data in
2 the encoded information and the data representing the randomly distributed
3 features obtained by analyzing the authentication object.

4
5 23. The label as recited in Claim 22, wherein the data in the encoded
6 information is compressed by:

7 determining a probability density function associated with the
8 authentication object;

9 determining vectors associated with the randomly distributed attributes
10 based, at least in part, on the probability density function; and

11 encoding the vectors using an arithmetic coding algorithm.

12
13 24. The label as recited in Claim 22, wherein encoded information is
14 included in the label as a barcode.

15
16 25. The label as recited in Claim 22, wherein encoded information is
17 encoded using a private key.

18
19 26. The label as recited in Claim 22, further comprising:
20 textual data that includes a string of characters, wherein the compressed
21 data is encrypted using the textual data.

22
23 27. The label as recited in Claim 26, wherein compressed data is
24 encrypted by:

25 hashing the textual data with an algorithm; and

1 encrypting the compressed data using the hashed textual data.

2
3 28. An apparatus comprising:

4 means for determining randomly distributed features in an authentication
5 object;

6 means for compressing data representing the randomly distributed features;

7 means for encoding the data with a signature; and

8 means for creating a label that includes the authentication object and the
9 encoded data.

10
11 29. The apparatus as recited in Claim 28, further comprising

12 means for incorporating fibers in the authentication object as the randomly
13 distributed features.

14
15 30. The apparatus as recited in Claim 28, further comprising:

16 means for determining a probability density function associated with the
17 authentication object;

18 means for determining vectors associated with the randomly distributed
19 attributes based, at least in part, on the probability density function; and

20 means for encoding the vectors using an arithmetic coding algorithm.

21
22 31. The method as recited in Claim 28, further comprising:

23 means for determining textual data that includes a string of characters;

24 means for hashing the textual data with an algorithm;

1 means for encrypting the compressed data using the hashed textual data;
2 and
3 means for including the textual data in the label.
4

5 32. The apparatus as recited in Claim 28, further comprising:
6 means for authenticating the label by comparing encoded data with the data
7 associated with the randomly distributed features in the authentication object.
